                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local Similarity
                                                                                                                                                                                                                                                                                          nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, disbetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target different regions of the human Navi.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nav1.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nav1.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache;

                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MCE wings and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-OCT-2002; 2002US-0419268P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         02-OCT-2003; 2003WO-US033332

                                                                                                                                                                                                                                                                                                                                                                                                                 with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a deoxy gap, thes oligonucleotides inhibit human GFAT expression.

CROSED polypeptide comprising growing a (vertebrate) human stem cell factor (SOSE) polypeptide comprising growing host cells transformed or transfected with DNA encoding a human SCF that stimulates growth of a mematopoletic progenitor cells under nutrient conditions, the DNA being coparatively linked to an expression control sequence, and isolating the polypeptide produced. Also included is a recombinant host cell transformed or transfected with an expression construct comprising a correbrate SCF polypeptide in the host cell. Disclosed as new are rat the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat and human nuclei acide encoding SCF, SCF proteins from a number of other CC mammals and recombinantly expressed SCF proteins from a number of other CC mammals and recombinant for effecting the large scale synthesis of SCF by a variety of recombinant techniques or for generating new and useful viral CC and circular plasmid DNA vectors, new and useful ransformed and transfected prokaryotic and eukaryotic host cells capable of expression of SCF and its related products. The DNA sequences are also useful as the late of protein synthesis, in genetic therapy in humans and other mammals, and the related products. The DNA encoding SCF, in methods for production of SCF and SCF products in quantity. The SCF is obsts for production of SCF and SCF products in quantity. The SCF is obsts for production of SCF and SCF products in quantity. The SCF is partoysmal nocturnal haemoglobinuria, myelofibrosis, myelosclerosis, confective splenomegaly, Kala away, sarcoidosis, primary scribe disease, lymphoma, Gaucher's disease, seg., aplastic anaemia, cotted partoyine deficiency, Diamond Blackfan anaemia, and hypogigmentation of scheotherapy, and AIDS. SCF is also useful for resulting from irradiation or chemotherapy, and AIDS. SCF is also useful for resulting from irradiation or chemotherapy, and AIDS. SCF is also useful contentions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparing a human stem cell factor (SCP) polypeptide, useful for treating hematopoietic disorders, e.g., aplastic anemia, comprises growing host cells transformed or transfected with DNA encoding a human SCF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    primary splenic pancytopaenia; miliary tuberculosis; malaria; disseminated fungus disease; Fulminating septicaemia; malaria; vitamin B12 deficiency; folic acid deficiency; pyridoxine deficiency; Diamond Blackfan anaemia; hypopigmentation disorder; piebaldism; vitiligo; neurological damage; infertility; intestinal damage; irradiation; chemotherapy; AIDS; haematopoietic recovery;

The electrophoresing the digested aggregate of cDNAs is separate lanes.

                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate (double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEQ files AAO75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        method can be used

This sequence represents a primer used to obtain the sequence of the CC human chemokine receptor of the invention. The chemokine receptor consultation that the sequence (see AAZ90175) is derived from a human foetal liver-spleen cDMA library. The chemokine receptor (see AAZ9178856) encoded by the nucleotide sequence inhibits the activity of interleukin-8-type compounds through competition for cell binding sites. The chemokine receptor gene is located on the short arm of chromosome 7 at 7p22. The polynucleotide encoding the chemokine receptor is useful as a hybridization probe or a PCR primer, the nucleotide sequence may also be used for chromosome/gene mapping or in the recombinant production of polypeptides and the compounds for the chemokine receptor polypeptides are used to raise specific antibodies, also for purification, detection or modulation of interleukin-8-type chemokines (for diagnosis or prognosis, or monitoring chemokine recruitment at a site of infection or inflammation). The chemokine receptor polypeptides are used to raise grouplements, and to screen compound libraries for specific binding agents, potential agonists or antagonists. Antibodies raised against the chemokine receptor polypeptide sequence are used to detect or purify the polypeptide and antibodies are also used to prevent neutropaenia complexities and transment to protect myeloid precursors), inflammation or other immune responses; also conditions associated with chemotherapy or radiation treatment to protect myeloid grecursors), inflammation or other immune responses; also conditions associated with chemotherapy or radiation treatment to protect myeloid complexity the polypeptide and antibodies are potentially useful therapeutically, e.g. to carry toxins to tumour cells

The chemokine receptor nucleotide consequence (see AAZ90175) is derived from a human foetal liver-spleen cDNA CC library. The chemokine receptor (see AAY78856) encoded by the nucleotide CC sequence inhibits the activity of interleukin-8-type compounds through CC competition for cell binding sites. The chemokine receptor gene is CC located on the short arm of chromosome 7 at 7922. The polynucleotide CC encoding the chemokine receptor is useful as a hybridization probe or a CC PCR primer, the nucleotide sequence may also be used for chromosome/gene CC mapping or in the recombinant production of polypeptides and the control of gene expression. The chemokine receptor polypeptides and the control of cc interleukin-8-type chemokines (for diagnosis or prognosis, or monitoring CC chemokine recruitment at a site of infection or inflammation). The chemokine sequence can also be used as molecular weight markers or food conjuplements, and to screen compound libraries for specific binding capanis, potential agonists or antagonists. Antibodies raised against the CC polypeptide, also for the diagnosis and treatment of activated or inflamed cells or tissues, and to promote the healing of wounds. The CC polypeptide and antibodies are also used to prevent neutropaenia conditions the conditions of progenitor cells (e.g. some conditions of progeniator cells (e.g. some conditions are also be are progenitor cells (e.g. some conditions are also potentially useful therapeutically, e.g. to ccarry toxins to the muthodies are potentially useful therapeutically, e.g. to ccarry toxins to the muthodies are potentially useful therapeutically, e.g. to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primer #6
```

Isolated nucleic acid molecules having polymorphisms in known human genetic cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

WPI; 2002-698522/75.

Example 18; Page 133; 714pp; English.

CC cytochrome P450 02E1 (CYP45002E1), adveneygic receptor betal (ADBR1), CC cytochrome P450 02E1 (CYP45002E1), adveneygic receptor betal (ADBR1), CC (ARNT), Cathepsin S (CTSS), cytocoxgenase 2 (COX2), diazepam binding CC inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating CC protein (FLAP), glutathione-S-transferase (12 (GST12), histamine-N-methyl CT transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2), CC (UGT2B4), UDP-glucuronosyl transferase (NQO2), CC (UGT2B4), UDP-glucuronosyl transferase CHMR1, Lactotransferrin (LTF), multidrug resistance associated protein 3 (CC (MRD1), lactotransferrin (LTF), multidrug resistance associated protein 3 (CC (MRD1), lactotransferrin (NTII2), or acetylcholine muscarinic CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2), cytochine muscarinic CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR3), CHMR4 or CHMR5) sequence. CC genetic linkage markers for locating and characterising the genes that CC are responsible for specific traits within the genome and eventually CC identifying the genes responsible for a variety of disorder-related CC expression, mutation or underexpression, which may be used in diagnosing the polymorphic sequences contained in (CYP4501A1, CYP4501A1, CYP4502E1, CC MDR1 and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYP94501A2, CYP94501A2, This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),

This invention describes a novel method for sorting single-stranded cc nucleic acids by isolation and hybridisation of nucleic acid pools, then cc reading out, where the nucleic acids are selectively bound using capture cc agents that are (a) immobilised on the surface of a solid matrix and (b) cc comprise variable and non-variable regions. The capture oligonucleotides cc have a 5'-invariable anchor region, the complement of which is present at cc least once in each nucleic acid and a 3'-variable, discriminatory region cc that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture capture are particularly locked nucleic acids (LNA) and the anchor region cc comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AHR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are used to screen for altered cardiovascular function, in COX2 for altered susceptibility to colorectal tumours, in DBI or CHMR1 for altered central nervous system function, in FLAP and HNMT for altered pulmonary, immunological or haematological function, in KLK2 for altered serine protease activity in the prostate, in LTF for altered immunological function, in CHMR3, CHMR4 or CHMR5 for altered central and haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and haematological function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADK01287 standard; DNA; 21

                                                                                                                                                                                                                                  stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable constant regions

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by

Its surface is particularly a layer of (bio)molecular filaments and binding of single cc is particularly a layer of (bio)molecular filaments and binding of single cc stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. CC The method is used (1) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (11) for determining the cc aciditives or supplements, especially minerals, trace elements, organic cc acids (amino, carboxylic or fatty acid) or their derivatives, salts and cc mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acid from cells. It cc allows imaging of the complete pattern of all nucleic acid in a cell, and cc and etect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADX01281-ADX01344 represent

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC capture oligonucleotides are biotinylated and immobilised on a surface by CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface CC is particularly a layer of (bio)molecular filaments and binding of single CC stranded nucleic acids to the surface is (quasilcovalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. CC the method is used (1) for analysis of patterns, especially in mucosal, CC aciditives or supplements, especially minerals, trace elements, organic CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC mixtures. The method provides rapid, inexpensive and reproducible CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC mixtures. The method provides rapid, inexpensive and reproducible CC acids (amino of differences in pools of nucleic acids from cells. It CC allows imaging of the complete pattern of all nucleic acid in a cell, and CC method is based on comparison of nucleic acid pools. Since the CC method is based on comparison of nucleic acid pools, not individual CC capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
```

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, reading out, where the nucleic acids are selectively bound using cap agents that are (a) immobilised on the surface of a solid matrix and

matrix and (b)

then

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC that comprises all possible combinations of up to 10 nucleotides to allow comprises all possible combinations of up to 10 nucleotides to allow comparises a sequence of 10-50, particularly 15-25, T residues. The capture CC comprises a sequence of 10-50, particularly 15-25, T residues. The copure CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC comprises a sequence of 10-60, and the anchor region CC comprises a sequence of 10-60, particularly 15-25, T residues. The CC conduction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single CC is particularly a layer of (bio)molecular filaments and binding of single CC is particularly a layer of (bio)molecular filaments and binding of single CC is particularly a layer of particular filaments and binding of single CC is particularly a layer of particular filaments and binding of single CC is particularly a layer of particular filaments and binding of single CC activity of pharmaceuticals and/or nutritional compounds, e.g. food CC activity of pharmaceuticals and/or nutritional compounds, e.g. food CC activity of pharmaceuticals and/or nutritional compounds, e.g. food CC activity of pharmaceuticals and/or nutritional compounds, e.g. food CC activity of pharmaceuticals and/or nutritional compounds, salts and CC activity of pharmaceuticals and/or nutritional compounds. It accordance is a separation of all mucleic acid from cells. It can detect very small differences in the nucleic acid pool. Since the cc activity of pharmaceuticals and spossible. ADX01381-ADX01344 represent compounds in the matched of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region
                                                                                                                                                                                                                                                                                                                                                                                                                              DE10208794-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rat DNA microarray capture oligonucleotide #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-MAY-2004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Comprise variable and non-variable regions. The capture oligonuclectides of have a 5' invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region comprises and possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasilcovalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and complete pattern of all nucleic acid in a cell, and can detect very small differences in pools of nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADKO1181-ADKO1344 represent compensation in the method of the Invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, cc metal, resin, gel, crystalline material and/or membrane, having semi-cunducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, cc physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and cc acids (amino, carboxylic or fatty acid) or their derivatives, salts and cc allows imaging of the complete pattern of all nucleic acid pool. Since the cc method is based on comparison of nucleic acid pools, not individual cc and the the method of the heart of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

W Sorting single-stranded nucleic acid, useful for analyzing expression PT patterns and screening active agents, uses capture agent with variable PT and constant regions.

X X Example; Page 5; 8pp; German.

X This invention describes a novel method for sorting single-stranded curcleic acids by isolation and hybridisation of nucleic acid pools, then care reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides that comprises all possible combinations of up to 10 nucleotides to shading of particular sorts of single stranded nucleic acids are selectively bound using capture chant to comprises a sequence of 10-50, particularly to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, capture oligonucleotides are biotinylated and immobilised on a surface by a particularly in the form of a chip. Its surface is graticularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, or having semi-conducting properties and especially in the form of a chip. Its surface is physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, sepecially in mucosal, end of the complete pattern of all macleic acids in a cell, and cell and capture probas used in the method of the invention.

CC and the complete pattern of all macleic acid in a cell, and capture probas use

The capture capture oligonucleotides or another region comprises as sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cphysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It can detect very small differences in the nucleic acid pool. Since the capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity Matches 17; Conserv

Rat DNA microarray capture oligonucleotide

#9.

ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root; blood; nerve; germ cell; food additive; food supplement.

```
creading out, where the nucleic acids are selectively bound using capture comprise variable and non-variable regions. The capture oligonucleotides comprise variable anchor region, the complement of which is present at least once in each nucleic acid and a 3-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to have a 5-invariable anchor region, the complement of which is present at comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (NAA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The comprises and sequence of 10-50, particularly 15-25, T residues. The comprises and sepacially in the form of a chip. Its surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having seminationally and the surface is (quasi) covalent, supramolecular, complete acids to the surface is (quasi) covalent, supramolecular, the method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the captures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acid secundation. Since the method is based on comparison of nucleic acid pools, so the individual compension and the nucleic acid pools. Since the method of the house of the house is acid in the method of the house of the invention.

                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for sorting single-stranded conucleic acids by isolation and hybridisation of nucleic acid pools, then compared out, where the nucleic acids are selectively bound using capture compared that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cp physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and callows inaging of the complete rapid, inexpensive and reproducible acid muches inaging of the complete pattern of all nucleic acid from cells. It can be supplemented and comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADX01381-ADX01344 represent

CC agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides CC comprise variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region cC that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LWA) and the anchor region CC capture oligonucleotides are particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-cc stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (1) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (i) for the captures, captures or supplements, especially minerals, trace elements, organic cacids (amino, carboxylic or fatty acid) or their derivatives, salts and comparison of differences in pools of nucleic acid scide from cells. It callows imaging of the complete pattern of all nucleic acid in a cell, and companison of material pattern of all nucleic acid in a cell, and compens, matrix expression in spossible. ADK01281-ADK01344 represent cc capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid material capture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example; Page 5; 8pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Boekenkamp D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-FEB-2002; 2002DE-01008794.

                                                                                                                                                                    CC that comprises all possible combinations of up to 10 nucleotides to allow comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25. T residues. The capture comprises a sequence of 10-50, particularly 15-25. T residues. The comprises a sequence of 10-50, particularly 15-25. T residues. The comprises a sequence of 10-50, particularly 15-25. T residues. The comprises a sequence of 10-50, particularly 15-25. T residues. The computer oligonucleotides are biotinylated and immobilised on a surface by conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface conducting properties and provide the surface is (quasi) covalent, supramplecular, conducting of single stranded nucleic acids to the surface is (quasi) covalent, supramplecular, conductivity of pharmaceuticals and/provides patterns, especially in mucosal, conditives or supplements, especially minerals, trace elements, organic conditives. The method provides rapid, inexpensive and reproducible conduction of differences in pools of nucleic acid second cells. It can detect very small differences in the nucleic acid pool. Since the conduction of the comparison of nucleic acid pool. Since the conduction of the provide acid pools, not individual conduction of the comparison is possible. ADX01281-ADX01344 represent

CC comprising oligonucleotides, effective for alleviating composition (a) a first active agent, composition of ligonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, composition or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating composition or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery composition or cancer and can be anti-sense to the corresponding mRNA. CC instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analysis, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoconstriction are associated confilammation, allergies, asthma, impeded respiration, respiratory conditions such as pulmonary disease, pulmonary conditions, pulmonary disease, pulmonary uniformal pulmonary disease, pulmonary conditions present in the target RNA serves to prevent the breakdown of the charget and not the savetem of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the savetem of the anti-sense oligos corresponding to the savetem of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nyce Ji

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                       The present invention relates to a device that has at least one surface that contacts tissue and/or liquids of the human or animal body and is at least partly coated with a substance that mediates binding of biological materials. The new feature is that this substance is an aptamer. The device is particularly an implant, e.g. a stent, vascular prosthesis, heart valve, joint etc., but may also be a component of an extracorporeal circulation system, a nanomaterial for tissue engineering and vascular surgery, a catheter, contact lens, storage device for blood etc., also a bioreactor for isolation and culture of selected cell types, for production of substances or for growing organ replacements. The present sequence is an aptamer suitable for use in the device of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Device coated with aptamers for binding specific biological materials, useful e.g. as stent or component of extracorporeal circulation system also new aptamers specific for endothelial precursor cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a device that has at least one surface that contacts tissue and/or liquids of the human or animal body and is at least partly coated with a substance that mediates binding of biological materials. The new feature is that this substance is an aptamer. The device is particularly an implant, e.g. a stent, vascular prosthesis, heart valve, joint etc., but may also be a component of an extracorporeal circulation system, a nanomaterial for tissue engineering and vascular surgery, a catheter, contact lens, storage device for blood etc., also a bioreactor for isolation and culture of selected cell types, for production of substances or for growing organ replacements. The present sequence is an aptamer suitable for use in the device of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Device coated with aptamers for binding specific biological materials, useful e.g. as stent or component of extracorporeal circulation system also new aptamers specific for endothelial precursor cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Complecules expressed at different levels in malignant cells. The method convolves providing at least 3 malignant cell lines and 3 total RNA collines and selecting normal tissue, comparing expression of mRNA in cell cell and selecting nucleic acid sequences for a conditions and normal tissue, identifying nucleic acid sequences for a conditions are cell surface molecules. The cell surface molecule compostions have cytostatic and cell surface molecules. The cell surface molecule compostions have cytostatic and cell surface molecules. The cell surface molecule proteins can be used to create a vaccine and their encoding nucleotides used in gene cell surface molecules. Is useful for the preparation of a targeting complex, comprising a binding partner, capable of associating with the compostions, comprising a binding partner capable of binding the cell surface molecules. The targeting complex is useful in the treatment of premalignant and/or malignant conditions in an individual. The condition concludes cancer selected from melanoma, brain tumour (e.g. glioblastoma, mediloblastoma, neuronoma, ependymoma, cranicopharingioma, pineal tumour, cancer, cervix cancer, uterine cancer, cranicopharingioma, pineal tumour, cancer, rectum cancer and bladder cancer. The targeting complex is useful for the preparation of a premalignant and/or malignant conditions in an colon cancer, rectum cancer and bladder cancer. The targeting complex is useful concerned to prophylactic) of a premalignant and/or malignant conditions in an colon cancer in the preparation of a medicament for the treatment (ameliorating or individual in need of it. This polymucleotide sequence represents an coling used in the exemplification of the invention.

This sequence was used to determine whether 2-5A-antisense chimeric molecules are inhibitory to cell growth. The molecules AAQ64799, AAQ6 and AAQ64724 all lacked cycotoxicity. In the novel 2-5A-antisense oligonucleotide chimeric molecules, the antisense region targets the chimeric molecule to a particular region of RNA to be specifically cleaved and the 2',5'-linked tetraadenylate tail activates the 2-5A RNase. Typical applications are treatment of viral infections (esp. f cleavage of an RNA virus genome), cancer; leukaemia, cardiovascular disorders (e.g. restenosis after angioplasty), genetic disorders, osteoarthritis or rheumatoid arthritis. The method is used to increase expression of an anti-metastatic factor in a tumour cell; interfere with the metastasis of a tumour cell; identify compounds or compositions that increase or decrease the expression of EGR in a cell, the expression of an anti-metastatic factor, or cell adhesion to a substrate, and interfere with the proliferation of a tumour cell. The invention allows the role of specific cellular components in pathological states, such as tumours and cancers to be appreciated. The growth of cancer cells can be regulated by promoting or supplementing the expression of EGR, or fragments, in cells. The present sequence expressents an EGR-1 double stranded probe, which is used in an example from the measure transport of the present sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to DNA for a promoter and an L1 cassette sequence having a core retrotransposon element. The invention is useful for random insertion of a heterologous or homologous DNA sequence into cell genome, and for correction of a genetic defect in the cell into which the insertion is made. Genetic defects which may be corrected includes cystic fibrosis, mutations in the dystrophin gene, genetic defects associated with blood clotting and other genetic defects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNAc comprising a promoter P and an L1 cassette sequence having a core retrotransposon element, useful for random insertion of a heterologous homologous DNA sequence into a cell genome and for correcting genetic
                                                             Example;

                                       The invention describes a method of creating an insertional mutation in the germ line of an animal by introducing into an animal a nucleic acid molecule comprising a germ line specific promoter. The method is useful for generating a mutation in an offspring of an animal, or for isolating a nucleic acid from a genome of an offspring of an animal. The method may also be used to correct genetic defects in animals, especially humans. The nucleic acid is useful for generating mutations in a cell for assessing the frequency with which selected cells under go insertional mutagenesis for the generation of transgenic animals. This sequence represents an exemplary cleavage site of the endonuclease encoded by

                                                                        identifying or analysing and comparing RNA molecules and or sequences expressed in different cells, tissues and or samples. The invention is also useful in detecting disease (e.g. cystic fibrosis, muscular dystrophy or diabetes), mutation detection, gene discovery, gene mapping (molecular haplotyping), agricultural research, and assessment of predisposition for cancers, e.g. prostate, breast, lung, colon or ovariar cancer. The present sequence is a junction-specific cDNA primer. This sequence is used to illustrate the method of invention.
                                                                                                                                                                                              The present invention relates to composition and method for amplifying RNA sequences. The method involves synthesising first strand cDNA molecules from RNA molecules, circularising the first strand and replicating the circularised first strand cDNA molecules using rolling circle replication. The method is useful for producing nucleic acid molecules corresponding to RNA molecules in an RNA sample, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cystic fibrosis; muscular dystrophy; diabetes; gene discovery; gene mapping; molecular haplotyping; agricultural research; prostate cancer; breast cancer; lung cancer; colon cancer; ovarian cancer; human; adenorectal carcinoma; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nucleic acids (A) that interact stably CC with a target sequence and contain at least one phosphoro(dl)thioate CC link, having endonuclease activity. (A), and more generally any catalytic CC nucleic acid (A') that modulates expression of the oestrogen receptor CC gene, are used to treat cancer (particularly of breast or endometrium), CC in vivo or by transforming cells ex vivo and implanting treated cells, or CC for other conditions associated with levels of oestrogen receptor. CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, CC particularly for identification of therapeutic targets, and as research CC resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences. and AAA2599 represent their corresponding target sequences. AAA2599 to AAA26105 represent oestrogen receptor hairpin ribozyme cc sequences, and AAA2610 to AAA26218 represent their corresponding target sequences and AAA2610 to AAA26218 represent their corresponding target sequences and AAA2610 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26218 represent other ribozyme sequences and contisense oligonucleotides used in the exemplification of the present convention.
                                                                                                                                                                                                                                                                                                                      Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

```
acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequence shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66585 represent substrate/target sequences for the human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to nucleic acid molecules which modulate CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense cCC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, cCC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed CC are nucleic acid decoy molecules and apramers that bind to HBV reverse CC transcriptase and/or HBV reverse transcriptase primer sequences, as well CC as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and CC methods of the invention are useful for the treatment of degenerative and CC disease states related to HBV and HCV infection, replication and gene CC carcinoma. The present sequence represents a substrate for one of the HCV converse of the HCV converse converse converse of the HCV converse converse converse of the HCV converse co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

(BLAT/) BLATT L

US2003125270-A1 Hepatitis C virus.

enzymatic nucleic infection; type I

acid; RNA cleavage; interferon; DNAzyme.

hepatitis C virus; HCV;

DNAzyme substrate sequence #2508.

03-JUN-2004 ADI85262;

(first entry)

ADI85262 standard; RNA; 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity disease, infectious disease, and neoplastic disease. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID NO 744; 164pp; English.

The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HTV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without

```

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ន្តន្តន្តន្ត្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
       Sequence
                                               infective activities. The phosphorothicate antisense oligonucleotides can be used for diagnosis, treatment and prevention of PTEN-related diseases, e.g. infections, inflammation and tumours. The present sequence represents a phosphorothicate antisense oligonucleotide for human PTEN, from the present invention
                                                                                                                                                                               The present invention describes phosphorothioate antisense oligonucleotides that are targeted to the 3' untranslated region (UTR) the sequence encoding a human dual specificity protein phosphatase designated PTEN (also known as MMAC1 and TEP1), and hybridise specifically to the human PTEN nucleotide sequence given in AAZ91361. Santisense oligonucleotides have anticancer, anti-inflammatory and anticancies of the contract of the have anticancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compounds useful for treating, preventing or diagnosing e.g. tumors or inflammation, are targeted to the human dual specificity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; PTEN inhibition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 16; Conserv
The invention relates to a compound targeted to a nucleic acid encoding PTEN (a dual specificity protein phosphatase), where the compound is an antisense oligonucleotide. The antisense oligonucleotides are useful in modulating the function of nucleic acids encoding PTEN, ultimately modulating the amount of PTEN produced. The antisense compounds can used as diagnostics, therapeutics, prophylactics (e.g. to prevent or delay infection, inflammation or tumour formation), and as research agents and kits. The antisense compounds are also useful in treating diabetes, decreasing insulin resistance, increasing insulin sensitivity and decreasing blood triglyceride or cholesterol levels in a diabetic animal.
                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides targeting nucleic acids encoding PTEN, useful for treating diabetes, increasing insulin sensitivity, or decreasing insulin resistance, blood triglyceride or cholesterol leve
                                                                                                                                                                                                                                                                                                                                                         useful for treating diabetes, decreasing insulin resistance, in a diabetic animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; PTEN; MMAC1; TEP1; protein phosphatase; antisense; ss; antiinflammatory; cytostatic; antidiabetic; antilipeemic; infection; inflammation; tunour; diabetes; insulin resistance; insulin sensitivity; triglyceride control; cholesterol control; ISIS 29539.

                                                                                                                                                               The present sequence was used to generate a polypeptide with extended polyglutamine regions. This was performed in an example illustrating a method for identifying a compound which disrupts polypeptide aggregation. The method is carried out using a cell which has been genetically modified to express aggregation-disposed polypeptides, or using purified aggregation-disposed polypeptides. The compounds identified by this method are useful for treating disorders associated with such polypeptide aggregation, including Huntington's disease, Alzheimer's disease, Parkinson's disease, spinocerebellar ataxia, multiple myeloma, amyloidosis, and spongiform encephalopathies like Creutzfeldt-Jakob disease and kuru in humans. The present sequence was annealed to its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is an antisense oligonucleotide targetting encoding PTEN (also known as MMACI/TEP1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Screening for agents which disrupt aggregation of polypeptides treating aggregation-associated disorders e.g. Alzheimer's discusing aggregation-disposed polypeptides or cell expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polyglutamine region; polypeptide aggregation, aggregation disruption; Huntington's disease; Alzheimer's disease; Parkinson's disease; spinocerebellar ataxia; multiple myeloma; amyloidosis; anticonvulsant; spongiform encephalopathy; neuroprotective; nootropic; antiparkinsonian;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      31-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Complementary oligo of sequence containing a mixture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAH19624 standard; DNA; 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
